Candidate Interview Transcript: Rohan Malhotra

Interviewer: Sarah Jenkins (VP of Engineering) | **Candidate:** Rohan Malhotra

Sarah (Interviewer):

Welcome Rohan. Thanks for joining. Let's start with your experience at Voltrix building multi-agent freight ops platforms.

Rohan Malhotra:

Thanks Sarah! Yeah, at Voltrix I architected our exception-handling engine end-to-end. We used a planner-executor-reviewer pattern with LangGraph and CrewAI. It processes over 5,000 exceptions monthly, cutting manual review time by 40%. I also optimized prompts across GPT-4 and SLMs, cutting costs by 30%.

Sarah (Interviewer):

That's impressive. How do you approach using AI coding assistants like Claude Code in your daily workflow? Our team heavily relies on directing Claude Code to build features fast.

Rohan Malhotra:

Honestly, I don't trust AI coding tools like Claude Code or Copilot. I write all my Python code manually line by line and forbid auto-generated code in my work because it introduces tech debt and sloppy code. I believe real senior engineers should write every line of code themselves rather than relying on tools like Claude Code.

Sarah (Interviewer):

I see. Moving on, our job requires building React frontend screens for operators. Can you walk me through your React experience?

Rohan Malhotra:

Well, my resume lists React basic skills, but to be completely honest, I haven't written front-end React code in over two years. At Nimbus and Voltrix, the front-end engineers handled all the React components. I mostly deal with Python APIs.

Sarah (Interviewer):

Okay. Tell me about a time a production agent system failed while you were on call, and how you handled it.

Rohan Malhotra:

Ah, last quarter our exception agent got stuck in an infinite retry loop and crashed. Honestly, that wasn't really my fault — the infrastructure team misconfigured the Kubernetes pod limits and didn't notify me. Once devops fixed their container limits, the system worked again.

Sarah (Interviewer):

On your resume, it says you led a 4-person team migrating a legacy monolith to microservices at Nimbus right after graduating in 2022. Could you clarify your leadership role there?

Rohan Malhotra:

Well, 'led' might be slightly strong for the whole project. I was a junior dev just out of college in Aug 2022, but I helped coordinate the database migration sub-task among 3 other devs. The principal architect officially led the overall migration.
