

Cargonet AI — Job Description

AI Engineer — Agentic Systems (Freight Operations)

Company: Cargonet AI — a freight-tech company that runs AI 'agent' systems in real production, handling shipment quoting, booking, tracking, document processing, and fixing errors automatically.

About the Role

We need an engineer to help improve our existing AI agent system (planner, executor, reviewer, and specialized agents working together). This is not a research-only job. You will build real features that go live for real users, mostly by directing AI coding tools (like Claude Code) rather than writing every line by hand — and you'll be responsible for fixing things when they break in production.

What You'll Do

- Improve the multi-agent AI system powering freight ops (quoting, booking, tracking, OCR document processing, error handling).
- Build features mainly by directing AI coding tools (like Claude Code) — reviewing and guiding their output, not just writing code yourself.
- Work on the Python backend (microservices) and React.js front-end, using MongoDB to build clean operator interfaces.
- Improve prompting, tools/memory access, RAG / vector search, and model selection (balancing quality vs cost).
- Keep the live system running smoothly — find and fix bugs when an AI agent misbehaves, taking full ownership in production.
- Connect system to external carrier APIs, business software, and OCR document scanning for invoices and BOLs.

What We're Looking For

- Solid Python backend skills (building REST APIs, microservices).
- Real hands-on experience with AI/LLM systems (prompt engineering, RAG/vector search, evaluation).
- Comfortable taking ownership when something breaks in production.
- Basic React.js skills for building simple front-end screens.
- Nice to have: experience with logistics/freight, document scanning (OCR), or system integrations.
