Candidate Interview Transcript: Maya Lin

Interviewer: Sarah Jenkins (VP of Engineering) | **Candidate:** Maya Lin

Sarah (Interviewer):

Hi Maya! Thanks for taking the time. To start, how do you work with AI coding tools like Claude Code?

Maya Lin:

Hi Sarah! Directing AI tools like Claude Code and Cursor is central to my daily development. I write tight spec prompts, review the generated Python and React diffs, write unit tests to verify the logic, and iterate. It allows me to ship backend endpoints and React screens 3 times faster than manual coding.

Sarah (Interviewer):

Great! How do you handle frontend React requirements alongside Python backends?

Maya Lin:

At FreightPulse, I owned full-stack operator screens. I build React interfaces with state management to let dispatchers see live shipment statuses and override agent decisions. On the backend, I write FastAPI endpoints and MongoDB queries.

Sarah (Interviewer):

How do you handle production outages when an AI agent misbehaves?

Maya Lin:

I take direct personal ownership. Last month, an OCR parser failed on a corrupted carrier bill of lading, causing our booking agent to halt. I jumped on call, added guardrails and fallback parsing in Python within 20 minutes, deployed the patch, and added automated regression tests so it wouldn't happen again.

Sarah (Interviewer):

What about complex multi-agent frameworks like LangGraph or CrewAI?

Maya Lin:

To be transparent, I haven't built heavy custom multi-agent orchestrators using LangGraph from scratch yet. My experience has been with focused agent loops, RAG pipelines, and API integrations. But I am eager to learn LangGraph and scale multi-agent patterns here.
